VENOMX
VENOM DESENSITIZER

TAKE CONTROL. NEUTRALIZE THE THREAT. EMPOWER YOUR ADVENTURES. DEFEND AGAINST VENOM.

Greetings to Interested Retailers and Other Parties!

We would like to introduce you to the second-generation patented VenomX Venom Desensitizer, the successor to the original patented Snake Doctor. It is a small hand-held first aid device which delivers a quick high voltage shock to the site of a venomous bite or sting. When applied to the bite site, the voltage is calibrated to deliver a large dose of free electrons (aka, anti-oxidants). This rapid infusion of electrons at the bite or sting site provides an exact charge to limit the oxidative damage to local tissue caused by venom. In addition, the electrons may change the charge and valence of the metalloproteinase components of the venom, rendering it inactive. The brief shock is able to destabilize localized venom proteins, desensitizing the venom.

The original Snake Doctor has been used by physicians, veterinarians, explorers, world travelers, scientists, ranchers, farmers, gardeners, outdoorsmen, hikers, snorkelers, mariners, etc. The ER physician who participated in designing the second generation VenomX Venom Desensitizer, has treated almost 400 patients since the mid 1990s and has never had a failure. Veterinarians have used the first-generation Snake Doctor to treat hunting dogs and other animals injured by venomous bites and stings, for decades. Many of these first-generation units manufactured in the 1980s are still in use.

Published studies have shown great success with treating brown recluse spiders. The Journal of the Oklahoma Medical Association has published 3 successive reports detailing successful use and resolution of the spider bite symptoms. Other studies have shown success with a variety of bites and stings. Our team has successfully used this technology to treat scorpion bites, brown recluse bites, bee and other stings, and jellyfish stings. We have a national and an international wait list of orders to fulfill as the units become available.

This unit is powered by a 9-volt battery. We purposefully chose this design feature over a re-chargeable unit because of the durability and for international users who live where electricity is not always readily available. In our experience, the 9-volt batteries are durable and last for many years.

The second-generation device has two major modifications, limited shock discharge and an extending electrode. We didn't want it to be considered a "stun gun" so we limited the discharge to milliseconds. The second modification is adding the functionality to use an extending electrode, which comes with the unit, along with a nylon soft case with a Velcro closure and a loop for carrying on a belt.

The Venom Desensitizer is a type of "insurance policy." It's recommended for immediate treatment, but it can be used up to weeks and even months after the initial incident for those with chronic bite- or sting-related symptoms. We still recommend all victims locate medical help as soon as possible after a bite or sting. The Venom Desensitizer does not replace medical interventions but is compact enough to take on the trail, a boat, your backpack or on your belt when you venture into the great outdoors where venomous creatures live and defend their spaces.

We welcome all inquiries. For additional information and documentation, contact Dr. Crystal Whitten, PhD at 1.817.879.4980 (PST), email: phytochemwhitten@yahoo.com or www.venomx.us or www.venomx.world.
